BEFORE

FOGGING SKID UPGRADE UTILIZING CALDWELL ENERGY'S PROPRIETARY CONTROL SYSTEM

AFTER

POWERFUL ADVANTAGES ONLY CALDWELL ENERGY CAN OFFER

Caldwell Energy Company's patent-pending closed loop control system for fogging and wet compression systems uses state of the art components to control the precise amount of moisture that is introduced into the combustion turbine air stream. This approach allows the customer to fine tune the system, thus protecting their largest asset, the combustion turbine. The Caldwell Energy control system uses instruments which are located downstream of the fogging arrays to measure the amount of fog that is introduced into the air stream via a variable speed pump. The control system is able to monitor pump skid health parameters to assure its owner of a reliable, long lasting system. As always, Caldwell Energy systems are backed by an industry leading three year warranty.
